/152 cont./

804 reflective and sly facial expression is exactly the same as ours.

O. Techniques

439 511 A definite domestic industry is present. Whatever the Auin really needs, he is able to manufacture for himself. All imported objects are luxury items. I make an exception in the case of the iron lance points, but I believe that if necessary the Bushman could even do without them.

463 The beginnings of a division of labor can be seen in the fact that only certain individuals practice the smith's trade, which, incidentally, does not extend to the manufacture of lance points.

323 Pottery is unknown.

439 Pots, supposedly from the Okovangga, are to be found sporadically. The Auin, however, is unable to repair such a vessel, as by puttying.

285 Rings of braided grass are manufactured. I myself have never seen them, since they are only made of young, but no longer green grass, in other words, shortly after the rainy season.

[294] It is said that at the same time of year certain special artists braid hat-like head coverings.

The grass rings and hats have only a limited durability, for in September and October there was none left for me to see.

[415] Sieves are made of parallel grass leaves joined together by thin strings. They are used to strain food.

"Kirris" are made with attractive decorations (Fig. 12).

413 531 A root stock with a knotty end is peeled and made smooth. A kind of pyrography is practiced on it by wrapping it, leaving bare spaces, with a long strip of the wet bark that was peeled off, and then placing the entire stick in red-hot coals. The unwrapped parts burn to a black color, while the other parts remain white.

I could not learn the purpose of these decorated sticks among the Auin. They use rough, pointed sticks for digging sticks. The kirris, therefore, seem to be luxury articles.

412 Iron knives, sharpened pieces of iron, or lance points are used as tools. As an example of pyrography, see the pipe plug, page 33.

Chapter 7

The Bushmen of the North

114 Our best information concerning the Masarwa comes from Dornan (1) and Holub (2). In what follows an outline sketch will

[113]

2. Holub, Die Masarwa.

be given of the culture of this tribe, based upon these two authors.

342 According to Dornan, the Masarwa once preferred to live in caves, where their ancestors had made paintings. The Bush-
[285] men in the Wankie and Ngami districts have plaited mats of grass or reed, with which they cover their windscreens. Sometimes they make a kind of roof covered with grass; otherwise they have ordinary windscreens.

[113] South Africa, 1910.)

322 For the wood of the bow the Masarwa use very straight
411 little tree trunks. After the bark is removed, they are tied to a straight tree and left to dry. The wood is then given its final drying over the fire and is placed in water so that it will not splinter. The middle of the bow is also commonly wound with tendons. The bow is often greased and never unstrung. The finished bow is smoothed with a rough stone.

221 433 Unfortunately spring is the most difficult season for the Herero as well as for the Bushmen. The good grazing for livestock is miles distant from the waterholes. Consequently the cattle are in poor condition and their yield of milk is low.

251 It would be useful for the Bushmen to amass a surplus of food in anticipation of this scarce season. However, none of the 15 independent camps observed ever kept more than a few days supply of vegetable foods on hand. Surplus accumulation was not a feature of Bushmen food strategy except for one instructive case.

There was a noticeable attempt to create a small surplus 251 in the form of dried meat and hides. Each family maintained • 285 a storage basket in the crotch of a young tree. By weaving a framework of branches and palm fronds and lining this with grass, they built up a rough basket for storing weapons, water containers and small amounts of food. The storage basket was built five feet above the ground which kept its contents safe from the reach of dogs and children. If a day's hunting had been unsuccessful, the members of a camp could invariably produce an emergency ration of dried meat or, more often, dried hide for the evening meal. People saved scraps of dried hide of kudu, gemsbok and wildebeeste from kills made weeks or 251 252 months previously. These scraps were softened by boiling or 262

the ground and covered with grass. The description of the Naron hut given by Miss Bleek[1] applies equally to the huts of most of the other Northern Bushmen.[2] "The women do all the building here. The men may cut a few branches, but their wives plant them in a semicircle, tie the tops together with a thong or bark fibre, put smaller sticks in between them, and thatch the whole with grass, making a cosy little wind screen. In bad weather chunks of wood are often laid on top to keep the grass in place. The size and the care with which a hut is built vary with the season: in dry weather a very slight shelter suffices, just a little sloping screen perhaps made by sticking grass in the branches of a bush. As the rainy season approaches a proper semicircular hut is made, from four to five feet high, the opening to leeward of course, and when the rain really comes, the half circle is increased to about a three-quarter circle, often thereby changing the direction of the opening in accordance with the different wind. There is no door; the opening is about four feet high." The whole structure is easily put up, and is abandoned without misgiving. If the next halting place is near, the women carry some of the materials over; if not, new material is always at hand.

Among the Cape Bushmen light portable huts equally simple in make were sometimes seen. A few bent sticks formed the framework, which was covered with mats made of reeds laid side by side and neatly sewn together. The whole structure was hemispherical in shape, about four feet in diameter, and only some three feet in height. When the encampment broke up, the mats were rolled together, and used again at the next spot.[3] Somewhat larger huts made in the same way are also found among some of the North-Eastern tribes at the present time, e.g. the Hukwe and some of the Hiechware, but in general the grass hut is the prevailing kind.[4]

The floor in the interior of the hut is usually scooped out a little, making a sort of nest, in which the inmates sleep; this is lightly strewn with dry grass, which is often changed. In front of the hut is the fireplace, marked by a mound of ashes rising higher daily and sheltering the opening. Here all the cooking is done, save in wet weather, when it is often done inside the hut. At night a second little fire is made in the middle of the hut, or just inside the opening. Round

372 decorated with burned lines) on which meat is roasted, and scoops
[412] for hoeing out the earth loosened with the digging-stick. The North-
[415] western tribes also manufacture wooden cooking pots (sometimes decorated with burned patterns of simple design), calabashes for holding fat and other liquids, eating vessels and spoons, as well as pestles and mortars, the latter often provided with a stone bottom,
[283] which are used for pounding up dried berries, etc. Wood fibre is twisted into cord, from which they prepare their snares and sometimes their bow-strings and make nets for carrying their belongings.

824 Reeds provide them with arrow-shafts and with the tubes for
283 sucking up water, as well as with the material from which they make
[412] their fish-traps and weave closely-stranded mats for sifting ants' eggs. Reed mats are also occasionally used in the building of their huts.

237 Ostrich egg-shells are converted into bottles for holding water,
[415] and are also broken up into very small pieces from which the women
[306] make their beads. Tortoise-shells are used as spoons and scoops, and are also made into powder boxes for containing *buchu*. Small
412 drills are made of stone for the manufacture of ostrich egg-shell
324 beads, larger ones for the manufacture of serpentine pipes; two or
[439] three stones are also used as anvils for working the iron obtained by
[326] barter, or for the purpose of grinding berries, and besides these a few smaller stones are to be seen used for hammer stones or rubbing stones.
178 The other types of stone implements, which link up the Bushmen with
324 the prehistoric cultures of South Africa, are now almost certainly no
[323] longer made; nor, too, are the crude pots of clay formerly used by the Cape Bushmen.

281 From the skins of animals killed in the chase, again, are made karosses, loin cloths, sandals, caps, leather bags, quivers, tobacco pouches, etc. The sinew is used for making bowstrings, for reinforcing the shafts of the bows and arrows, and as thread for sewing skins, while in some cases it also provides the string for the nets in which
321 personal belongings are carried. The long bones of the ostrich and various kinds of big game are used for making the foreshafts and points of arrows, while other bones are made into knives, awls, pipes, etc. Horns are manufactured into spoons, whistles, small quivers for carrying arrow-points during the rainy season, implements for
[237] stripping the fibre required for snares, artificial leeches, etc., while
[415] the stomach of large animals, when not required for food, is fashioned into bags for collecting the blood and for carrying water.
